

Are Electric Cars the Future?

Dr Paul Nieuwenhuis

13th March 2012

5pm reception in VJ Gallery for a 5.30pm lecture
Small Chemistry Lecture Theatre, Main Building, Cardiff University, CF10 3AT

This public lecture will discuss the future of sustainable motoring to celebrate National Science and Engineering Week which this year is exploring 'Our World in Motion'.

The technology of cars has taken a natural path over the last one hundred years from mechanical to electrical, in tandem with improvements in this technology.

Is it therefore inevitable that all cars will be electric in the future?

- If so, where will this increased electricity supply come from?
- Will there be a radical change in the current business model of buying, making and running a car?
- Can we overcome the issue of 'range anxiety'?

Please register your attendance by emailing brass@cf.ac.uk

The lecture is hosted by the ESRC Centre for Business Relationships, Accountability, Sustainability and Society (BRASS) based at Cardiff University and ENEVATE as part of National Science & Engineering Week which is coordinated by the British Science Association.
